

# Trigger Method Development- Self-Heating

CATL

# Introduction

- ❖ The remarkable feature of this method is that there is **no additional energy** compared to a fully charged cell
- ❖ The purpose of this method is to **use the energy discharged by the battery itself**, heating a physical resistance to trigger the battery go to thermal runaway
- ❖ Easy for assembling
- ❖ Possible for automatic control
- ❖ ...

# Test Set Up : Self-Heating Method

❖ Test procedure(brief , see the attachment for details) :

- ❖ Assembly
- ❖ Switch on, start self-heating
- ❖ Switch off once thermal runaway

## The resistor we used in this

Type	Dimension	Rated capacity	Suitable cell
Metal insulated	130*90*3mm	300~600w (approx. 5 w/cm <sup>2</sup> )	Pouch & Prismatic

Heater under development

## Proposed heater selection rule

- The resistance sealed without “heated and flushed metal” exposure
- Resistor selection: wouldn't melt cell can/pouch package, and heating power should smaller than the continuous current interrupter that the cell can bear, but enough for thermal runaway initiation
- The heater should parallel to the cell surface, and similar area with the contacted cell surface is preferred, which wouldn't lead additional gap between cell-cell or cell-end plate.

# Test Set Up : Self-Heating Method(Detailed Draft)

<p>Pre-condition</p>	<ul style="list-style-type: none"> <li>• Temperature: <math>25 \pm 5^{\circ}\text{C}</math></li> <li>• Humidity: 15%~90%</li> <li>• Air condition: <math>\leq 10\text{m/s}</math></li> <li>• Voltage acquisition accuracy: <math>\pm 0.5\text{mV}</math></li> <li>• Atmospheric pressure : 86kpa~106kpa</li> <li>• Resistance acquisition accuracy: <math>\pm 2\text{m}\Omega</math></li> </ul>
<p>Process</p>	<ul style="list-style-type: none"> <li>• Connect the self-heating resistance with the initiation cell, which is from the positive electrode (or negative electrode) to the heating resistance, see Figure 1</li> <li>• Any external wires need be acquired, which provides the way to charge the disperse units of the modified module.</li> <li>• Heating area of the self-heater is directly contacting the cell surface and it is not larger than the surface of that.</li> <li>• The heater position is correlated with the temperature sensor position, which is described in Figure 2.</li> <li>• The state of charge (SOC) shall be adjusted.</li> <li>• After installation, the self-heater should be reached to its fixed power, which depends on the energy of the battery pack.</li> <li>• Turn off the switch, when thermal runaway occurs. The temperature and voltage should be observed in period..</li> <li>• The test shall be conducted at an indoor test facility or in a shelter to prevent the influence of wind.</li> </ul>

Fig2. Schematic diagram of temperature sensor layout during heating

# Single Cell Test Result\_ An Example

Prismatic

# Energy Transformation

- ❖ **Q : Energy release before cell thermal runaway,  $Q = \int_0^{t^1} i dt$**
- ❖  **$Q_b$  : Total Energy absorbed by the heating resistance,  $Q_b = \int_{T_0}^{T^1} C_{p\_h} * m_h * dT$**
- ❖  **$Q_c$  : Dissipated heat with the environment,  $Q_c = \int_{T_0}^{T^1} h * A dT$ ,  $h=5 \text{ W}/(\text{m}^2 * \text{K})$**
- ❖  **$Q_d$ : Radiant Energy,  $Q_d = \epsilon * A * \sigma * (T_1^4 - T_2^4)$ ,  $\sigma = 5.67 * 10^{-8} \text{ W}/(\text{m}^2 * \text{K}^4)$**

Sample	Q(kJ)	$Q_b$ (kJ)	$Q_c$ (kJ)	$Q_d$ (kJ)	$(Q_b + Q_c + Q_d)/Q$
Example	~198.4	~5.1	~2.3	~1.9	~4.7%

# Module Level Test Result\_ An Example

## ❖ Prismatic module-1

### ❖ 1P4S

### ❖ Triggered cell :

#### ❖ ~95%SOC

### ❖ Measured data include :

- ❖ Cell and module voltage
- ❖ Bottom temperature of the cell
- ❖ Photographs before , during and after the test

# Demo Pack Test Result\_ An Example

❖ Thermal runaway propagated to the other cells.

# Summary

- ❖ Draft heater selection rules have been proposed
- ❖ No additional energy during the Self-Heating test , and most of the energy (normally <5% heat capacity effect and heat dispersant) is re-entered into the battery by Self-Heating;
- ❖ We will continue to study the method, including heater development, procedure standardize and automatic control switcher etc.
